DESCRIPTION

COMPONENTS

The alantoína. There has been verified that the alantoína chemically the glioxil-diurea is a stimulant of the epitelización of the skin for stimulus of the cellular proliferation. It helps to eliminate the fabrics necróticos, unviable, replacing them with new fabrics. Other one of his actions is to act as antiirritant, protecting the skin of the action of acid or alkaline substances, soaps or oils.

Proteins and vitamins, which the snail obtains acroá his vegetable supply. The proteins contribute to the good condition trófico of the skin, having antiinflammatory properties, which in this case there promotes the action of the natural antibiotics contained in the same substratum.

Collagen and elastina. These two important components of the skin are also the slobber of snail.

Acid glicólico. It is an alfa hidroxíácido that applied to the skin and according to his concentration, can produce from a light descamación up to an intense peeling. The acid glicólico, it facilitates the elimination of superficial caps of the skin.
